

# Writing Equations of Lines Given Slope & a Point

So far in Unit 5, you have been able to determine the y-intercept from either a graph or an equation in slope intercept form. How will you find the y-intercept or equation of a line without a graph or equation? You can use the slope intercept form or point slope form to find the y-intercept or equation of a line if you know the slope and a point on the line.

<b>Method 1: Writing Equations Using Slope Intercept Form: <math>y = mx + b</math></b>	<b>Method 2: Writing Equations Using Point Slope Form: <math>(y - y_1) = m(x - x_1)</math></b>
<ol style="list-style-type: none"> <li>1. Write the formula: <math>y = mx + b</math>.</li> <li>2. Substitute the value of the slope in for <math>m</math> and the value of the point in for <math>x</math> and <math>y</math>.</li> <li>3. Solve the equation for <math>b</math>.</li> <li>4. Substitute the value of <math>m</math> and the newly founded <math>b</math> into the formula: <math>y = mx + b</math>.</li> </ol>	<ol style="list-style-type: none"> <li>1. Write the formula: <math>(y - y_1) = m(x - x_1)</math>.</li> <li>2. Substitute the value of the slope in for <math>m</math> and the value of the point in for <math>x_1</math> and <math>y_1</math>.</li> <li>3. Solve the equation for <math>y</math>.</li> </ol>

**Ex 1:** Write the equation of a line if  $m = 9$  and passes through the point  $(2, 11)$ .

**Method 1:**

$$\begin{array}{l}
 1.) y = mx + b \\
 2.) 11 = 9(2) + b \\
 3.) 11 = 18 + b \\
 \quad \underline{-18 \quad -18} \\
 \quad -7 = b
 \end{array}
 \qquad
 \begin{array}{l}
 4.) m = 9 \quad b = -7 \\
 \boxed{y = 9x - 7}
 \end{array}$$

**Method 2:**

$$\begin{array}{l}
 1.) (y - y_1) = m(x - x_1) \\
 2.) (y - 11) = 9(x - 2) \\
 3.) \begin{array}{r} y - 11 = 9x - 18 \\ \quad +11 \quad \quad +11 \\ \hline y = 9x - 7 \end{array}
 \end{array}$$

**Ex 2:** Write the equation of a line with  $m = -8$  and passes through the point  $(3, 12)$ .

**Method 1:**

$$\begin{array}{l}
 1.) y = mx + b \\
 2.) 12 = -8(3) + b \\
 3.) 12 = -24 + b \\
 \quad \underline{+24 \quad +24} \\
 \quad 36 = b
 \end{array}
 \qquad
 \begin{array}{l}
 4.) m = -8 \quad b = 36 \\
 \boxed{y = -8x + 36}
 \end{array}$$

**Method 2:**

$$\begin{array}{l}
 1.) (y - y_1) = m(x - x_1) \\
 2.) (y - 12) = -8(x - 3) \\
 3.) \begin{array}{r} y - 12 = -8x + 24 \\ \quad +12 \quad \quad +12 \\ \hline y = -8x + 36 \end{array}
 \end{array}$$

**Ex 3:** Write the equation of a line with  $m = 4$  and passing through the point  $(2, 5)$ .

**Method 1:**

$$\begin{array}{l}
 1.) y = mx + b \\
 2.) 5 = 4(2) + b \\
 3.) 5 = 8 + b \\
 \quad \underline{-8 \quad -8} \\
 \quad -3 = b
 \end{array}
 \qquad
 \begin{array}{l}
 4.) m = 4 \quad b = -3 \\
 \boxed{y = 4x - 3}
 \end{array}$$

**Method 2:**

$$\begin{array}{l}
 1.) (y - y_1) = m(x - x_1) \\
 2.) (y - 5) = 4(x - 2) \\
 3.) \begin{array}{r} y - 5 = 4x - 8 \\ \quad +5 \quad \quad +5 \\ \hline y = 4x - 3 \end{array}
 \end{array}$$

### Applications of Slope Intercept Form

<b>Y</b>	<b>=</b>	<b>M</b>	<b>X</b>	<b>+</b>	<b>B</b>
Output		Slope	Input		Y-intercept (0, b)
Dependent Variable		Rate	Independent Variable		Starting Amount One Time Fee
Range		$\frac{\text{change in } y}{\text{change in } x}$	Domain		

When a problem involves a **constant rate or speed and a beginning amount**, it can be written using slope intercept form. You need to recognize which value is the slope and which is the y-intercept.

**Example 1:** Suppose you receive \$100 for a graduation present, and you deposit it into a savings account. Then each week after that, you add \$20 to your savings account.

Complete the following (some may need to be calculated):

Independent Quantity: (x) weeks  
 Dependent Quantity: (y) \$ in savings  
 Slope: (m) \$20  
 Y-intercept: (b) \$100  
 Equation:  $y = mx + b$   
 $y = 20x + 100$

When will you have \$460?

\* plug 460 in for y  
 $y = 20x + 100$   
 $460 = 20x + 100$   
 $-100 \quad -100$   

---

 $360 = 20x$   
 $20 \quad 20$   
 $18 = x$   
 weeks

When a word problem involves a **constant rate or speed and gives a relationship at some point in time between each variable**, you need to use  $y = mx + b$  to find the b value/y-intercept to create an equation to model the relationship.

**Example 2:** Marty is spending money at an average rate of \$3 per day. After 14 days, he has \$68 left. How much money did he begin with?

Complete the following (some may need to be calculated):

Independent Quantity: (x) 14 days  
 Dependent Quantity: (y) \$ left - \$68  
 Slope: (m) \$3  
 Y-intercept: (b) ?  
 Point(s): (14, 68)  
 Equation:  $y = mx + b$   
 $68 = 3(14) + b$   
 $68 = 42 + b$   
 $-42 \quad -42$   
 $26 = b$   
 $y = 3x + 26$   
 \$ began with

After 6 days, how much money does he have remaining?

\* plug 6 in for x  
 $y = 3x + 26$   
 $y = 3(6) + 26$   
 $y = 18 + 26 = \$44$
